Skin Care for the **Food Industry**

A Comprehensive Skin Care Concept

Prevention of occupational skin diseases

A personalised skin care programme in just a few clicks: www.handcareplan.com

Skin protection products are used before and during work. They are designed to prevent the skin from being damaged by potentially harmful substances and should protect effectively against those substances the skin is exposed to during work. Skin cleansing products have to ensure efficient cleansing without straining occupationally stressed skin additionally. Therefore, an unnecessarily strong skin cleanser should never be used. Skin care products are applied to dry and clean skin after work. They support the skin's regeneration capability and renew its natural protective barrier.

The following products are specifically designed for workplaces where food is handled (food industry, kitchens, agriculture, packaging, etc.). They are formulated without fragrances or colorants and comply with HACCP principles. These products help you and your employees meet the highest standards of professional skin care in food-handling environments.

Our Expertise Is Your Advantage

Occupational skin diseases are by far the greatest health risk at work. In Europe, around one third of all confirmed occupational diseases affect the skin. Experts assume that the percentage of skin diseases is actually even higher. Effective skin care at work is essential for a long and healthy working life. With PGP, you have a competent and committed partner offering high-quality solutions for your specific needs.

Glove wearers
e.g. gloves or rubber boots
